A,Title: The Genome of the Natural Genetic Engineer Agrobacterium tumefaciens C58.

A,Fitle: The Genome of the Natural Genetic Engineer Agrobacterium tumefaciens C58.

A,Accession: AD3143

A,Status: preliminary

A,Molecule type: DNA

A,Rolecule type: DNA

A,Rolecule type: DNA

A,Ecssidees: 1-145 < KKR>

A,Experimental source: strain C58 (Dupont)

A,Experimental source: strain C58 (Dupont)

A,Gene: Atu468

A,Gene: Atu468

A,Map position: linear chromosome

regulation of telomere length.

-!-CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl} (N)-acceptor = nicotinamide + {ADP-D-ribosyl} (N-1)-acceptor.
-!-SUBUNIT: Oligomerizes and associates with TNKS2. Interacts with the Cytoplasmic domain of LNEEP/Ordse in SLC2A4/GLUT4-vesicles.
-!-SUBCELLULAR LOCATION: Cytoplasmic, associated with the Golgi and with juxtanuclear SLC2A4/GLUT4-vesicles.
-!-SUBCELLULAR LOCATION: Cytoplasmic, associated with the Golgi and with juxtanuclear sore scores of a minor proportion is also found at nuclear pore complexes and around the pericentriolar matrix of mitotic centromeres. During interphase, a small fraction of TNKS is found in the nucleus, associated with TRF1.
-!-ALTERNATIVE PRODUCTS:
-!-Event-Alternative splicing, Named isoforms=2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EMBL; AF082555; AAC79841.1; -.

Note=No experimental confirmation available;
TISSUE SPECIFICITY: Ubiquitous; highest levels in testis.
PTM: Upon insulin-stimulation, phosphorylated on serine residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -!- PTM: ADP-ribosylated (-auto).
-!- SIMILARITY: Belongs to the PARP family.
-!- SIMILARITY: Contains 15 ANK repeats.
-!- SIMILARITY: Contains 1 sterile alpha motif (SAM) domain.
                                                                                                                                                                                                                                                                                                                               IsoId=095271-1; Sequence=Displayed;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ANK 1. -!-FUNCTION: Essential for biological clock functions. Determines the period length of circadian and ultradian rhythms; an increase in period length of circadian and ultradian rhythms and a decrease leads to shortened circadian rhythms and a decrease leads to lengthened circadian rhythms. Essential for the circadian rhythmic component of the male courtship song that originates in the thoracic nervous system. The biological cycle depends on the complex Light induces the degradation of TIM, which promotes complex. Light induces the degradation of TIM, which promotes elimination of PRR. Nuclear activity of the heterodamer coordinatively regulates PER and TIM transcription through a negative feedback loop. Behaves as a negative element in circadian transcriptional loop. Does not appear to bind DNA, suggesting indirect transcriptional inhibition (By similarity).

-!- SUBCELLULAR LOCATION: Nuclear at specific periods of the day.

-!- PTM: PHOSPHORYATED WITH A CIRCADIAN RHYTHMICITY, PROBABLY BY THE DOUBLE-TIME PROTEIN (DET). PHOSPHORYLATION COULD BE IMPLICATED IN THE STABILITY OF PER MONOMER AND IN THE FORMATION OF HETERODIMER DOUBLE-TIME PROTEIN (DET). PHOSPHORYLATION COULD BE IMPLICATED IN MISCELLANBOUS: THE SEQUENCE SHOWN IS THAT OF STRAIN ATLIXCO.

-!- SIMILARITY: Contains 2 PAS (PER-ARNT-SIM) dimerization domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. ```
copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonalia, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant Agfa protein which is useful feliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inspensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                      o.

The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA control encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbries (SEF17/TAF) nucleation depended assembly system of strains of Salmonella. Escherichia coli and control control control coli and the production of fimbries comprising recombinant control conformation of a recombinant gene into the chromosome of the homologue species; (3) directing recombinant gene into the chromosome of the homologue species, replacing the native comprising separating an aminologue species, replacing the native comprising separating an aminologue of the homologue species in an animal, comprising separating a replacement segment or segments of foreign animo containing a replacement segment or segments of foreign animo containing a replacement segment or segments of foreign animo containing a replacement segment or segments of foreign animo containing a replacement segment or segments of foreign animo containing a replacement segment or segments of foreign animo containing a replacement segment or segments of foreign animo containing a replacement segment or segments of foreign animo containing a replacement segment of a limbrial presentation containing a response in an animal. In a fimbrial presentation cyperced to system the hererologues antigens are presented in high numbers (up to system the hererologues antigens are presented in high numbers (up to concine, the carrier fimbrial submit protein are usually strong immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial submit proteins are usually strong immunogenist the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYDQ 120

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative finbriae (SERIY/TAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and AgfA, homologue finbrin subunits, respectively; (2) directing recombination of a recombinant gene compounds to the chromosome of the homologues species, (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the colymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a finhight in the contained that the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal.
                                                                                                                            Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 SDARKSETTITQSGYGNGADVGQGADNSTIBLIQNGFRNNATIDQWNAKNSDITVGQYGG 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQ--- 117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                            The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA segment of thin aggregative fimbriae (SEF1/7AE) muleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacterriaceae for the production of fimbriae comprising recombinant depended directing recombination of a recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising a recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence polymer into the animal in conjunction with a carrier or dilutent. (I) is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to 500,000 coptes/cell), the hybrid fimbrian protein possesses both the immunogenic the inserted epitope, and hybrid fimbriae are usually strong immunogens, which may be important for directing an immune response is given in the exemplification of the present invention in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                     Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYDQ 120

The nucleic acid can be used to provide diagnostic assays for Salmonella and/or eneropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide propriet or the sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic 25-MAR-2003 to correct PF field.)

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA concerns which encodes a foreign epicope or antigen. Also described are: (1) use of thin aggregative fimbries (SERIA/TAR) mucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and anticoli and control of a recombination of fimbries comprising recombinant of directing recombination of a recombination of a recombinant gene composed species, (3) directing recombination of a recombinant gene copy of that gene, and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or containing an immune response in an immune coli polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant for an efficient live of system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein see usually strong immunogencity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial submuit proteins are usually strong immunogens, which may be important for an elevant for an efficient live vaccine, the carrier fimbrial submuit protein see usually strong aminorems which may be important for an elevant for an efficient live the exemplification of the present invention
                                                                                                                                                                                                                              Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                     Kay WW;

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbried (SEPI)/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and control of a recombination control of the production of fimbried comprising recombinant GAGA, CSGA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombinant gene (comprising seperating a recombinant gene into the chromosome of the homologus species, replacing the native comprising separating an amino acid polymer comprising separating an amino acid polymer comprising separating an amino acid polymer comprising separating an amino acid polymer comprising separating an amino acid polymer comprising separating an amino acid polymer comprising separating an amino acid polymer comprising separating a replacement segment or segments of foreign amino correcting an immune response in an animal. Ecoli or correcting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to conquence) the carrier fimbrial subunit protein sale usually strong immunogens, which may be important for an efficient live vaccine; the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response confinence is given in the expensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYDQ 120

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA casegment of the gene has been replaced by a segment of a foreign DNA casegment of this encodes a foreign epitope or antigen. Also described are: (1) use of this encodes a foreign epitope or antigen. Also described are: casembly system of strains of Salmonella, Escherichia coli and content of the comparising recombination of Enterobacteriaceae for the production of fimbriace comprising recombinant on of a recombination of a recombinant gene into the chromosome of the homologue species, replacing the native copy of that gene; and (4) eliciting an immune respons in an animal, copy of that gene; and (4) eliciting an immune respons in an animal, comprising separating a replacement sequent or sequence or sequences grown on a Salmonella, E. coli or comprising separating an amino acid polymer comprising a replacement sequence or sequences grown on a Salmonella, E. coli or contenting an ential in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the hererologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live carrier the inserted epitope, and hybrid fimbria are usually strong immunogens, which may be important for directing an immune response conservancing the inserted epitope, and hybrid fimbrial semined easy and incomined against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are:
Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid finbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier finbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  i MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ

cc (1) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and casembly system of strains of Salmonella, Escherichia coli and Enterbacteriacae for the production of fimbriae comprising recombinant of monologous species, (3) directing recombination of a recombinant gene of the chomosome of the homologous species, replacing the active the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a replacement sequent or sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is confirmed to the combinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the hererologous antigens are presented in high numbers (up to conjuct or copies (cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong communogens, which may be important for directing an immune response cagainst the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in constant of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA segment which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative finbriae (SEP1/7AR) incleation depended assembly system of strains of Salmonella, Escherichia coli and Encaraceae for the production of finbriae comprising recombinant of a recombination of a recombinant pene into the chromosome of the homologous species, replacing the native comprising species, 3) directing recombination of a recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising are combinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or dilutent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to compise/Cell), the hybrid finbrin protein possesses both the
                                              Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                           The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epicope or antigen. Also described are: (1) use of thin aggregative finbries (SEPI/TAP) nucleation depended assembly system of strains of Salmonella, Eschericha coli and assembly system of strains of Salmonella, Eschericha coli and constraint of salmonella, Eschericha coli and adfact in the production of fimbries respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising the native copy of that gene, and (4) eliciting an immune response in an animal, comprising separating a replacement sequent or sequents of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or enteronome of the host cell, from the host cell and introducing the coliciting an immune response in an animal. The finbrial presentation system the heterologous antigens are presented in high numbers (up to cliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to concours, the carrier fimbrial subunit protein are usually strong immunogens, which may be important for directing an immune response consequence, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response in an invested epicope, and hybria fimbrial are are assy and inexted epicope, and hybrial fimbrial are are seasy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                    Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

The invention relates to an isolated peptide capable of binding a mammalian plasma protein or of generating an immune response in a mammal selected from sequences shown in ABRR2642, ABR264649. The peptide or antibody is useful for treating a bacterial infection in a human or animal or in the manufacture of a medicament for the prophylactic treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shigella infection. The peptide that is immobilized on a solid support is also useful as a reagent for determining the ability of a plasma protein, to bind to bacteria. The present sequence represents an E. coli 15 kba protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYDQ 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                         New isolated peptide capable of binding a mammalian plasma protein, useful in the manufacture of a medicament for the prevention and/or treatment of a bacterial infection, such as Escherichia coli, Salmonella
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MKLLKVAAFAAIVVSGSALAGVVPQWGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ
